一、 Ueditor 介绍

UEditor 是由百度 web 前端研发部开发所见即所得富文本 web 编辑器,具有轻量,可定制,注重用户体验等特点,开源基于 MIT 协议,允许自由使用和修改代码。

官网: http://ueditor.baidu.com/

第三方 sdk: http://ueditor.baidu.com/website/thirdproject.html

二、 Koa 中使用 koa2-ueditor

1. 安装 Koa2 的 koa2-ueditor:

npm install koa2-ueditor --save / cnpm install koa2-ueditor --save

2. 手动下载 koa2-ueditor

下载地址: https://github.com/sealice/koa2-ueditor
或者 https://github.com/htzhanglong/koa2-ueditor

下载完成以后把官方例子中的 example->public->ueditor 复制到我们的项目里面

3. 对应的 koa 业务逻辑中配置 koa2-ueditor 模块:

```
const ueditor = require('koa2-ueditor')
router.all('/editor/controller', ueditor(['public', {
         "imageAllowFiles": [".png", ".jpeg"]
         "imagePathFormat": "/upload/ueditor/image/{yyyy}{mm}{dd}/{filename}"
}]))
```

4. 在模板中引入 ueditor 静态文件

```
<script type="text/javascript" charset="utf-8" src="/ueditor/ueditor.config.js"></script>
<script type="text/javascript" charset="utf-8" src="/ueditor/ueditor.all.min.js"> </script>
<script type="text/javascript" charset="utf-8" src="/ueditor/lang/zh-cn/zh-cn.js"></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></script></sc
```

5、用到的文本框替换成下面代码

```
<script id="editor" type="text/plain" style="width:800px;height:300px;"></script>
```

6、实例化编辑器

```
var ue = UE.getEditor('editor'); //注意和第五条的 id 对应起来
```

7、编辑器放入内容

```
var ueditor = UE.getEditor('editor');
ueditor.addListener("ready", function (){ /*注意*/
// editor 准备好之后才可以使用
ueditor.setContent(`{{@list.content}}`);
```

});

三、 koa2-ueditor 的一些配置

ueditor 非常强大,可以自定义很多参数,找到 ueditor 里面的 ueditor.config.js 进行配置

配置上传资源接口: serverUrl *安全

配置导航显示内容: toolbars

配置自动长高: autoHeightEnabled:false
